

# Gallopedia

From **Gilani Research Foundation**

July 2013, issue # **285\***

Compiled on a weekly basis since January 2007

Gilani's Gallopedia is a weekly Digest of Opinions in a globalized world - one window on global opinion polling compiled by Gilani Research Foundation

## Who are we?

**Gilani's Gallopedia** is a weekly digest of opinions in a globalized world. It provides a one window access to Global Opinion Polls on a weekly basis. It is produced by a team of researchers led by Dr. Ijaz Shafi Gilani, and is a not for profit public service. It is co-edited by Mohammad Zubair and Sara Salam.

Our name reflects the rapid pace at which global polls are brought to the community of pollsters and other interested readers. Gilani's Gallopedia is not related to any polling agency and makes its selection from any publically available poll based on its relevance to our reader's interests. Over the years it has reported polls conducted by over **350** agencies and institutions.

## INSIDE THIS ISSUE

THIS WEEK'S REPORT CONSISTS OF **22** NATIONAL & MULTI COUNTRY SURVEYS. **08** POLLING ORGANIZATIONS HAVE BEEN REPRESENTED.

Pg **2** **Africa** zone  
this week- **01** national poll

Pg **2** **Euro Americas** zone  
this week- **14** national polls  
**Cyber World** – **04** Polls

Pg **7** **Topic of the week-**  
**NEW METHOD TO DO WORLD POLL,**  
**presented at WAPOR Annual Conference in Boston, May 2013 by Ijaz Gilani & Bilal Gilani**

Countries are represented in blue; Polling organizations are represented in pink. For reference to source of each poll clicks to detail are provided in the text

**Disclaimer:** Gilani's Gallopedia is a not for profit activity and every effort has been made to give attribution to respective polling organizations. 285-1 **About 5 in 10 Nigerians bought petrol above N97 per litre in 2nd Quarter of 2013** (Click for Details)

(Nigeria) The second quarter results for the Petrol Pump Price Monitoring Polls conducted by NOI Polls Limited reveals that between April and June 2013 an average of 52 percent adult Nigerians (about 45.2 million Nigerian adults) are still buying petrol above the official pump price of N97 per litre. This marks a 5-point decline from an average of 57 percent in Q1 2013. (NOI)

285-2 **Royal Baby Poll** (Click for Details)

(UK) A new Ipsos MORI poll shows that most Britons think Prince William and Kate Middleton's child should have a normal job before taking on royal duties, however, most also think it is impossible for royal children to have a normal upbringing. Meanwhile support for Britain remaining a monarchy remains high and more people think Prince Charles should not give up his right to the throne in favour of Prince William than think he should. (Ipsos MORI)

285-22 **NEW METHOD TO DO WORLD POLL** [\(Click for Details\)](#)

Ijaz Gilani and Bilal Gilani of Gilani Research Foundation argue that a sample of 10,000 men and women from any replicate of 1000 sampling blocks chosen by their software generates a truly global sample, which can produce global polls for trend data as well as cross-sectional analysis of key regions of the world. In their view their global-centric method can be done at affordable cost and rapid pace. They argue that their Method adopts a 'global-centric' approach instead of the conventional 'state-centric approach' to choose a sample of the world. The paper presents a list of 1000 Sampling Blocks from across the world. These Blocks were chosen randomly (PPS) by the authors from a larger list of 350,000 sampling blocks, which constitute their Global Census data. The authors have developed a Global Sampling Software which generates different types of samples to do global or world polls and regional polls. They argue that a global sample of 20,000 men and women can provide a truly representative poll of the world which can be replicated and used for trend data and cross-sectional analysis of key regions of the world. The authors believe that their global-centric method to do world polls can produce truly representative world polls at affordable cost and rapidly, possibly within a week's timeframe. The paper was presented at the WAPOR Annual Conference held in Boston in May 2013.

## Topic of the week:

### **NEW METHOD TO DO WORLD POLL**

- ▶ This page is devoted to opinions of countries whose polling activity is generally not known very widely or where a recent topical issue requires special attention.

Ijaz Gilani and Bilal Gilani of Gilani Research Foundation argue that a sample of 10,000 men and women from any replicate of 1000 sampling blocks chosen by their software generates a truly global sample, which can produce global polls for trend data as well as cross-sectional analysis of key regions of the world. In their view their global-centric method can be done at affordable cost and rapid pace.

The paper was presented earlier this year (May 2013) at the WAPOR Annual Conference in Boston, USA. Its synopsis is reproduced below:

**GLOBAL AND REGIONAL POLLS:** A Paradigmatic Shift from “State-centric” to “global-centric” Approach, by Ijaz Gilani and Bilal Gilani, Paper presented at WAPOR Annual Conference, Boston, May 2013.

### Background

In our view, the subject of global opinion polling is highly policy relevant. We feel that if we are able to standardize its methodology and apply it on a suitable range of subjects, it will greatly facilitate meaningful discourse among important segments of the global community and its increasingly globalized institutions and stakeholders.

### Concept

In that background we have tried to standardize the methodology summarized as ‘Global-centric method of sampling and surveys’. After considerable experimentation since the year 2000, we have arrived at a simple, but meaningful, conclusion: “As a principle, a global survey should treat the world (globe) as a unit and proceed to execute the standard principles observed in the conventional state-centric method. A number of adaptations are required. But in our view those do not alter the basic principles of sampling which are applicable to any group irrespective of its size.”

### Application

In its very essence the global-centric method treats the globe as one population entity and slices (stratifies) it rather than conceiving of the globe as a static mosaic of some 200 units (countries) from whom a selection is made (without disturbing the structure of units in the mosaic) to compile a multi-country survey. We argue that there is a paradigmatic difference between top-down approaches (SLICING), designed to start from the whole and choose a sample, and bottom up approach ('MOSAICING'), designed to choose from a mosaic and reconfigure it. We treat the former as global-centric and the latter as state-centric approach to measuring global opinion.

### Tool Kit

We have developed a suitable tool-kit for the application of our 'Global-centric method'. It includes the following three tools:

#### Global Census Data Base:

We have pooled primary census data at block, or suitably available level, from 177 countries, constituting 99.5% of global population. Currently the pool has over 350,000 census blocks. Each block has identified its population size and its share in the total global population. The global census database provides the 'universe' from which we choose designated number of census blocks (for example 1000) to conduct a global poll.

#### Global Demographic Database

All sample surveys require a strong demographic information about the population of their universe. Hence we require a globally accumulated demographic data base. We have compiled a working demographic data base by drawing upon the existing sources. The raw information comes from national sources but the compilation and easy retrieval/reconfiguration makes it suitable a tool-kit require for global-centric surveys.

#### Global-centric Sample selection software

We have developed a modest but easy to use software which facilitates the selection of a global sample from the global census data base.

#### SAMPLING PROCEDURE:

In principle the procedure is fairly identical to the conventional state-centric method. We choose a random number from the global population organized in a series. This provides the starting point. We choose the remaining census blocks through a sampling interval, choosing the block where the interval falls. The required number of blocks is determined by the Research Design, which in turn is guided by the unit of segmentation at which statistically reliable analysis is required. The entire global population is included in the series. The required number of sampling blocks gets chosen through the method of PPS (population proportionate to size). A designated number of interviews (say 10) can then be conducted in the statistically chosen census blocks across the world (say 1000). It provides a sample of 10,000 which should be a statistically reliable estimate of the global opinion. The opinions of its sub-units would be statistically reliable depending on the unit (or segment) of analysis. Our Global Census data base proposes a 3 tiered structure of segmenting the world into 3 Zones, 10 Regions and 40 sub-Regions. The 40 sub-Regions comprise 19 single-country sub-regions (all the G-20 countries, with approx. 62 percent of global population) and 21 multi-country sub-Regions (together containing the remaining 38 percent of global population). Statistically reliable opinions can be available for any of the 40 units. The level of reliability can be raised by raising the total sample size or boosting a unit which needs special inquiry. Again, the segmentation scheme can be altered to suit research needs and orientation as long as the basic principles are not violated.

#### Conceptual Somersault

All of this is standard practice; and that is the key lesson. Our Global-centric method simply extends the standard/conventional sampling methodology by turning it upside-down at the starting point. It starts with the world and ends at a country (or equivalent sub-regional unit) rather than beginning with the country and

adding up country data to compute global opinion. This conceptual somersault however requires a new tool-kit for translating Theory into Practice. The Global-centric method provides a 3 part tool-kit, constituting:

1. Global Census data
2. Global Demographic data
3. Global Sampling software

The need for such global tools has been explained earlier.

## Conclusion

Our view is that a global sample of 10-20,000 men and women would provide a sound sample at global level and a fairly sound segment analysis separately for each one of the G-20 countries (19+ other EU) as well as the rest of the world clubbed into 20 sub-regional groups. Thus, global opinion for the world as a whole and its 40 constituent units can be measured through a relatively small sample (say 10- 20,000), at an affordable cost and fairly rapidly, within a week, if need be.

Following the same logic, Regional polls can be organized by selecting regional samples through global-centric method. We are currently working on a proposal with Asia Barometer to conduct an Asia Poll through the global-centric method.

## CONTENT LIST

This paper is about the theory and practice of global surveys. It focuses on proposing a paradigmatic shift in multi country studies from a state-centric to a global-centric approach.

The paper has four sections which together explain the proposed approach.

### SECTION 1 & 2

The **first two sections** deal with the 'Theory of global sampling' which explains the difference between state-centric and global-centric sampling method. It also explains how we have developed a new geographical segmentation of the world and the justification for this new stratification. Moreover, it explains the procedures used to translate this theory into practice.

### SECTION 3

The **third section** deals with the 'Practice of global-centric surveys'. It provides a tool-kit which is required to translate the above mentioned theory into practice. This chapter explains the three tools: Global Census Data Base, Global Demographic Database and Global Sampling each of which forms a section in this chapter.

### SECTION 4

The **fourth section** deals with the 'Tests of global sampling' which provide evidence for the validity of the theory of global sampling. It makes a case for global-centric sampling by applying a series of tests on Asia Barometer as a case study.

## Gilani's Gallopedia (2007-2013)

### A Quantitative Analysis

A quantitative analysis of global polls monitored during the 4 year period January 2007 – January 2013

#### KEY STATISTICS

- 1- Number of Surveys (*a selection on key political and social issues*):  $\approx$  6,805 polls during the period 2007-2013
- 2- Subjects of Interest (*we have made a list of 125 subjects, further grouped into 9 broad categories, namely: **Governance**, **Globalization** (inclusive of global economic issues) **Global Conflicts** (conflict zones), **Global leaders** (USA and Emerging powers), **Global Environment**, **Family**, **Religion**, and **other miscellaneous***)
- 3- Number of **countries** covered by one or more surveys:  $\approx$  178 during the period 2007-2013
- 4- Number **polling organizations** whose polls have been cited:  $\approx$  358 during the period 2007-2013
